

Improve Printing with LRS and IGEL

IGEL Session Printer Agent (ISPA) offers many potential business benefits. It can help reduce costs, improve security and data protection, simplify administrative tasks associated with desktop deployment, and promote greater hardware utilization and consolidation. IGEL also improves worker mobility and provides businesses with greater flexibility and agility. However, printing in the IGEL environment can be problematic for administrators and users.

Administrators lack the tools to easily associate users, printers and terminals in an intelligent manner to improve the productivity and mobility of users. They also lack the ability to automate the management of dynamic deployment of printers across the IGEL desktops to ensure that the users receive the correct printers for their workflows.

These differences and challenges can result in user dissatisfaction, increased support calls, and additional administrative workload.

Easier Implementation with ISPA

The IGEL Session Printer Agent for VPSX application provides a complete solution for managing printer definitions in the IGEL environment. It supports an administrative capability to associate users, printers, and terminals in an intelligent manner, and ensures that these definitions are persistent across IGEL desktop sessions. This capability allows administrators to more easily support ‘proximity-based’ printing, so users can conveniently print nearby as they move from one terminal to another.

ISPA ensures that the correct terminal and user printer definitions are configured for the IGEL desktop, regardless of whether the user logged off or disconnected from their previous desktop session. By intelligently managing user-and terminal-specific printer definitions, a worker always has the ability to print to a nearby device, to their printer back at the office, or to any network printer that they are authorized to access.

Benefits of ISPA for IGEL Environments

Simplifies tasks and reduces workload of IT administrators to configure, change and maintain their IGEL print infrastructure

- Improves mobility by letting workers conveniently print documents near any terminal location in the enterprise
- Makes VDI transparent to users by giving them a similar print capability to what they had with traditional Windows desktops
- Reduces support calls due to fewer issues for users.

Extending Enterprise Output Management in your Organization

- Accounting
- Auditing
- Mobile Printing
- Pull Printing

The LRS Enterprise Output Server solution runs on these platforms:

- Microsoft Windows
- Linux
- Linux on IBM System z
- IBM AIX
- Sun Solaris
- HP-UX

Contact LRS to learn more about the IGEL Session Printer Agent and other Output Management solutions.
